$$\begin{aligned}B(x, y) &= \frac{\Gamma(x)\Gamma(y)}{\Gamma(x+y)} = 2 \int_0^{\pi/2} \sin^{2x-1}(\theta) \cos^{2y-1}(\theta) d\theta \\ &= \int_0^1 t^{x-1} (1-t)^{y-1} dt = \int_0^{\infty} \frac{t^{x-1}}{(1+t)^{x+y}} dt\end{aligned}$$

12.9. Función zeta de Riemann

La siguiente fórmula converge rápido para valores pequeños de n ($n \approx 20$):

$$\begin{aligned}\zeta(s) &\approx \frac{1}{d_0(1-2^{1-s})} \sum_{k=1}^n \frac{(-1)^{k-1} d_k}{k^s} \\ d_k &= \sum_{j=k}^n \frac{4^j}{n+j} \binom{n+j}{2j}\end{aligned}$$

12.10. Funciones generadoras

$$\begin{aligned}\sum_{n=0}^{\infty} \left(\sum_{k=0}^n a_k \right) x^n &= \frac{1}{1-x} \sum_{n=0}^{\infty} a_n x^n \\ \sum_{n=0}^{\infty} \binom{n+k-1}{k-1} x^n &= \frac{1}{(1-x)^k} \\ \sum_{n=0}^{\infty} p_n x^n &= \frac{1}{\prod_{k=1}^{\infty} (1-x^k)} = \frac{1}{\sum_{n=-\infty}^{\infty} x^{\frac{1}{2}n(3n+1)}} \\ \sum_{p=0}^{\infty} \frac{S_p(n)}{p!} x^p &= \frac{e^{x(n+1)} - e^x}{e^x - 1} \\ \sum_{n=0}^{\infty} n^k x^n &= \frac{\sum_{i=0}^{k-1} \langle k \rangle_i x^{i+1}}{(1-x)^{k+1}}, \quad k \geq 1\end{aligned}$$

Entonces se cumple que $xS'(x) + P(x)S(x) = 0$, donde $P(x) = \sum_{m=1}^{\infty} p_m x^m$ y $S(x) = \prod_{i=1}^n (1 - a_i x) = \sum_{m=0}^n (-1)^m s_m x^m$.

12.11. Números armónicos

$$\begin{aligned}H_n &= \sum_{k=1}^n \frac{1}{k} \approx \ln(n) + \gamma + \frac{1}{2n} - \frac{1}{12n^2} \\ \gamma &\approx 0.577215664901532860606512\end{aligned}$$

12.13. Ternas pitagóricas

- Una terna de enteros positivos (a, b, c) es pitagórica si $a^2 + b^2 = c^2$. Además es primitiva si $\gcd(a, b, c) = 1$.
- Generador de ternas primitivas:

$$\begin{aligned}a &= m^2 - n^2 \\ b &= 2mn \\ c &= m^2 + n^2\end{aligned}$$

donde $n \geq 1$, $m > n$, $\gcd(m, n) = 1$ y m, n tienen distinta paridad.

- Árbol de ternas pitagóricas primitivas: al multiplicar cualquiera de estas matrices:

$$\begin{pmatrix} 1 & -2 & 2 \\ 2 & -1 & 2 \\ 2 & -2 & 3 \end{pmatrix}, \quad \begin{pmatrix} -1 & 2 & 2 \\ -2 & 1 & 2 \\ -2 & 2 & 3 \end{pmatrix}, \quad \begin{pmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 3 \end{pmatrix}$$

por una terna primitiva \mathbf{v}^T , obtenemos otra terna primitiva diferente. En particular, si empezamos con $\mathbf{v} = (3, 4, 5)$, podremos generar todas las ternas primitivas.

12.14. Árbol de Stern–Brocot

Todos los racionales positivos se pueden representar como un árbol binario de búsqueda completo infinito con raíz $\frac{1}{1}$.

- Dado un racional $q = [a_0; a_1, a_2, \dots, a_k]$ donde $a_k \neq 1$, sus hijos serán $[a_0; a_1, a_2, \dots, a_k + 1]$ y $[a_0; a_1, a_2, \dots, a_k - 1, 2]$, y su padre será $[a_0; a_1, a_2, \dots, a_k - 1]$.

- Para hallar el camino de la raíz $\frac{1}{1}$ a un racional q , se usa búsqueda binaria iniciando con $L = \frac{0}{1}$ y $R = \frac{1}{0}$. Para hallar M se supone que $L = \frac{a}{b}$ y $R = \frac{c}{d}$, entonces $M = \frac{a+c}{b+d}$.

12.15. Combinatoria

- Principio de las casillas: al colocar n objetos en k lugares hay al menos $\lceil \frac{n}{k} \rceil$ objetos en un mismo lugar.
- Número de funciones: sean A y B conjuntos con $m = |A|$ y $n = |B|$. Sea $f : A \rightarrow B$:
 - Si $m \leq n$, entonces hay $m! \binom{n}{m}$ funciones inyectivas f .
 - Si $m = n$, entonces hay $n!$ funciones biyectivas f .
 - Si $m \geq n$, entonces hay $n! \left\{ \begin{smallmatrix} m \\ n \end{smallmatrix} \right\}$ funciones suprayectivas f .
- Barras y estrellas: ¿cuántas soluciones en los enteros no negativos tiene la ecuación $\sum_{i=1}^k x_i = n$? Tiene $\binom{n+k-1}{k-1}$ soluciones.
- ¿Cuántas soluciones en los enteros positivos tiene la ecuación $\sum_{i=1}^k x_i = n$? Tiene $\binom{n-1}{k-1}$ soluciones.
- Desordenamientos: $a_0 = 1$, $a_1 = 0$, $a_n = (n-1)(a_{n-1} + a_{n-2}) = na_{n-1} + (-1)^n$.
- Sea $f(x)$ una función. Sea $g_n(x) = xg'_{n-1}(x)$ con $g_0(x) = f(x)$. Entonces $g_n(x) = \sum_{k=0}^n \left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\} x^k f^{(k)}(x)$.
- Supongamos que tenemos $m+1$ puntos: $(0, y_0), (1, y_1), \dots, (m, y_m)$. Entonces el polinomio $P(x)$ de grado m que pasa por todos ellos es:

$$P(x) = \left[\prod_{i=0}^m (x-i) \right] (-1)^m \sum_{i=0}^m \frac{y_i (-1)^i}{(x-i)i!(m-i)!}$$

- Sea a_0, a_1, \dots una recurrencia lineal homogénea de grado d dada por $a_n = \sum_{i=1}^d b_i a_{n-i}$ para $n \geq d$ con términos iniciales a_0, a_1, \dots, a_{d-1} . Sean $A(x)$ y $B(x)$ las funciones generadoras de las sucesiones a_n y b_n respectivamente, entonces se cumple que $A(x) = \frac{A_0(x)}{1-B(x)}$, donde $A_0(x) = \sum_{i=0}^{d-1} \left[a_i - \sum_{j=0}^{i-1} a_j b_{i-j} \right] x^i$.
- Si queremos obtener otra recurrencia c_n tal que $c_n = a_{kn}$, las raíces del polinomio característico de c_n se obtienen al elevar todas las raíces del polinomio característico de a_n a la k -ésima potencia; y sus términos iniciales serán $a_0, a_k, \dots, a_{k(d-1)}$.

12.16. Grafos

- Sea d_n el número de grafos con n vértices etiquetados: $d_n = 2^{\binom{n}{2}}$.
- Sea c_n el número de grafos conexos con n vértices etiquetados. Tenemos la recurrencia: $c_1 = 1$ y $d_n = \sum_{k=1}^n \binom{n-1}{k-1} c_k d_{n-k}$. También se cumple, usando funciones generadoras exponenciales, que $C(x) = 1 + \ln(D(x))$.
- Sea t_n el número de torneos fuertemente conexos en n nodos etiquetados. Tenemos la recurrencia $t_1 = 1$ y $d_n = \sum_{k=1}^n \binom{n}{k} t_k d_{n-k}$. Usando funciones generadoras exponenciales, tenemos que $T(x) = 1 - \frac{1}{D(x)}$.
- Número de spanning trees en un grafo completo con n vértices etiquetados: n^{n-2} .
- Número de bosques etiquetados con n vértices y k componentes conexas: kn^{n-k-1} .
- Para un grafo no dirigido simple G con n vértices etiquetados de 1 a n , sea $Q = D - A$, donde D es la matriz diagonal de los grados de

cada nodo de G y A es la matriz de adyacencia de G . Entonces el número de spanning trees de G es igual a cualquier cofactor de Q .

- Sea G un grafo. Se define al polinomio $P_G(x)$ como el polinomio cromático de G , en donde $P_G(k)$ nos dice cuántas k -coloraciones de los vértices admite G . Ejemplos comunes:
 - Grafo completo de n nodos: $P(x) = x(x-1)(x-2)\dots(x-(n-1))$
 - Grafo vacío de n nodos: $P(x) = x^n$
 - Árbol de n nodos: $P(x) = x(x-1)^{n-1}$
 - Ciclo de n nodos: $P(x) = (x-1)^n + (-1)^n(x-1)$

12.17. Teoría de números

$$(f * e)(n) = f(n)$$

$$(\varphi * \mathbf{1})(n) = n$$

$$(\mu * \mathbf{1})(n) = e(n)$$

$$\varphi(n^k) = n^{k-1}\varphi(n)$$

$$\sum_{\substack{k=1 \\ \gcd(k,n)=1}}^n k = \frac{n\varphi(n)}{2}, \quad n \geq 2$$

$$\sum_{k=1}^n \text{lcm}(k, n) = \frac{n}{2} + \frac{n}{2} \sum_{d|n} d\varphi(d) = \frac{n}{2} + \frac{n}{2} \prod_{p^a|n} \frac{p^{2a+1} + 1}{p + 1}$$

$$\sum_{k=1}^n \gcd(k, n) = \sum_{d|n} d\varphi\left(\frac{n}{d}\right) = \prod_{p^a|n} p^{a-1}(1 + (a+1)(p-1))$$

- Lifting the exponent: sea p un primo, x, y enteros y n un entero positivo tal que $p \mid x - y$ pero $p \nmid x$ ni $p \nmid y$. Entonces:
 - Si p es impar: $v_p(x^n - y^n) = v_p(x - y) + v_p(n)$
 - Si $p = 2$ y n es par: $v_p(x^n - y^n) = v_p(x - y) + v_p(n) + v_p(x + y) - 1$
 donde $v_p(n)$ es el exponente de p en la factorización en primos de n .

- Suma de dos cuadrados: sea $\chi_4(n)$ una función multiplicativa igual a 1 si $n \equiv 1 \pmod{4}$, -1 si $n \equiv 3 \pmod{4}$ y cero en otro caso. Entonces, el número de soluciones enteras (a, b) de la ecuación $a^2 + b^2 = n$ es $4(\chi_4 * \mathbf{1})(n) = 4 \sum_{d|n} \chi_4(d)$.

- Teorema de Lucas:

$$\binom{m}{n} \equiv \prod_{i=0}^k \binom{m_i}{k_i} \pmod{p}$$

$$m = \sum_{i=0}^k m_i p^i, \quad n = \sum_{i=0}^k n_i p^i$$

$$0 \leq m_i, n_i < p$$

- Sean $a, b, c \in \mathbb{Z}$ con $a \neq 0$ y $b \neq 0$. La ecuación $ax + by = c$ tiene como soluciones:

$$x = \frac{x_0 c - b k}{d}$$

$$y = \frac{y_0 c + a k}{d}$$

para toda $k \in \mathbb{Z}$ si y solo si $d|c$, donde $ax_0 + by_0 = \gcd(a, b) = d$ (Euclides extendido). Si a y b tienen el mismo signo, hay exactamente $\max\left(\left\lfloor \frac{x_0 c}{|b|} \right\rfloor + \left\lfloor \frac{y_0 c}{|a|} \right\rfloor + 1, 0\right)$ soluciones no negativas. Si tienen el signo distinto, hay infinitas soluciones no negativas.

- Dada una función aritmética f con $f(1) \neq 0$, existe otra función aritmética g tal que $(f * g)(n) = e(n)$, dada por:

$$g(1) = \frac{1}{f(1)}$$

$$g(n) = -\frac{1}{f(1)} \sum_{d|n, d < n} f\left(\frac{n}{d}\right) g(d), \quad n > 1$$

- Sean $h(n) = \sum_{k=1}^n f\left(\left\lfloor \frac{n}{k} \right\rfloor\right) g(k)$, $G(n) = \sum_{k=1}^n g(k)$ y $m = \lfloor \sqrt{n} \rfloor$, entonces:

$$h(n) = \sum_{k=1}^{\lfloor n/m \rfloor} f\left(\left\lfloor \frac{n}{k} \right\rfloor\right) g(k) + \sum_{k=1}^{m-1} \left(G\left(\left\lfloor \frac{n}{k} \right\rfloor\right) - G\left(\left\lfloor \frac{n}{k+1} \right\rfloor\right) \right) f(k)$$

- Sean $F(n) = \sum_{k=1}^n f(k)$, $G(n) = \sum_{k=1}^n g(k)$, $h(n) = (f * g)(n) = \sum_{d|n} f(d)g\left(\frac{n}{d}\right)$ y $H(n) = \sum_{k=1}^n h(k)$, entonces:

$$H(n) = \sum_{k=1}^n f(k)G\left(\left\lfloor \frac{n}{k} \right\rfloor\right)$$

- Sean $\Phi_p(n) = \sum_{k=1}^n k^p \varphi(k)$ y $M_p(n) = \sum_{k=1}^n k^p \mu(k)$. Aplicando lo anterior, podemos calcular $\Phi_p(n)$ y $M_p(n)$ con complejidad $O(n^{2/3})$ si precalculamos con fuerza bruta los primeros $\lfloor n^{2/3} \rfloor$ valores, y para los demás, usamos las siguientes recurrencias (DP con `map`):

$$\Phi_p(n) = S_{p+1}(n) - \sum_{k=2}^{\lfloor n/m \rfloor} k^p \Phi_p\left(\left\lfloor \frac{n}{k} \right\rfloor\right) - \sum_{k=1}^{m-1} \left(S_p\left(\left\lfloor \frac{n}{k} \right\rfloor\right) - S_p\left(\left\lfloor \frac{n}{k+1} \right\rfloor\right) \right) \Phi_p(k)$$

$$M_p(n) = 1 - \sum_{k=2}^{\lfloor n/m \rfloor} k^p M_p\left(\left\lfloor \frac{n}{k} \right\rfloor\right) - \sum_{k=1}^{m-1} \left(S_p\left(\left\lfloor \frac{n}{k} \right\rfloor\right) - S_p\left(\left\lfloor \frac{n}{k+1} \right\rfloor\right) \right) M_p(k)$$

- En general, si queremos hallar $F(n)$ y existe una función mágica $g(n)$ tal que $G(n)$ y $H(n)$ se puedan calcular en $O(1)$, entonces:

$$F(n) = \frac{1}{g(1)} \left[H(n) - \sum_{k=2}^{\lfloor n/m \rfloor} g(k)F\left(\left\lfloor \frac{n}{k} \right\rfloor\right) - \sum_{k=1}^{m-1} \left(G\left(\left\lfloor \frac{n}{k} \right\rfloor\right) - G\left(\left\lfloor \frac{n}{k+1} \right\rfloor\right) \right) F(k) \right]$$
